

INTELLIGENT VIDEO SURVEILLANCE SYSTEMS FOR LOGISTICS 4.0

Are you ready to face your Digital Transformation?

You imagine, we create.

SCATI is a manufacturer of intelligent video systems specialized in creating comprehensive security solutions to meet the challenges of Digital Transformation.

WE PUT EYES ON YOUR PROCESSES

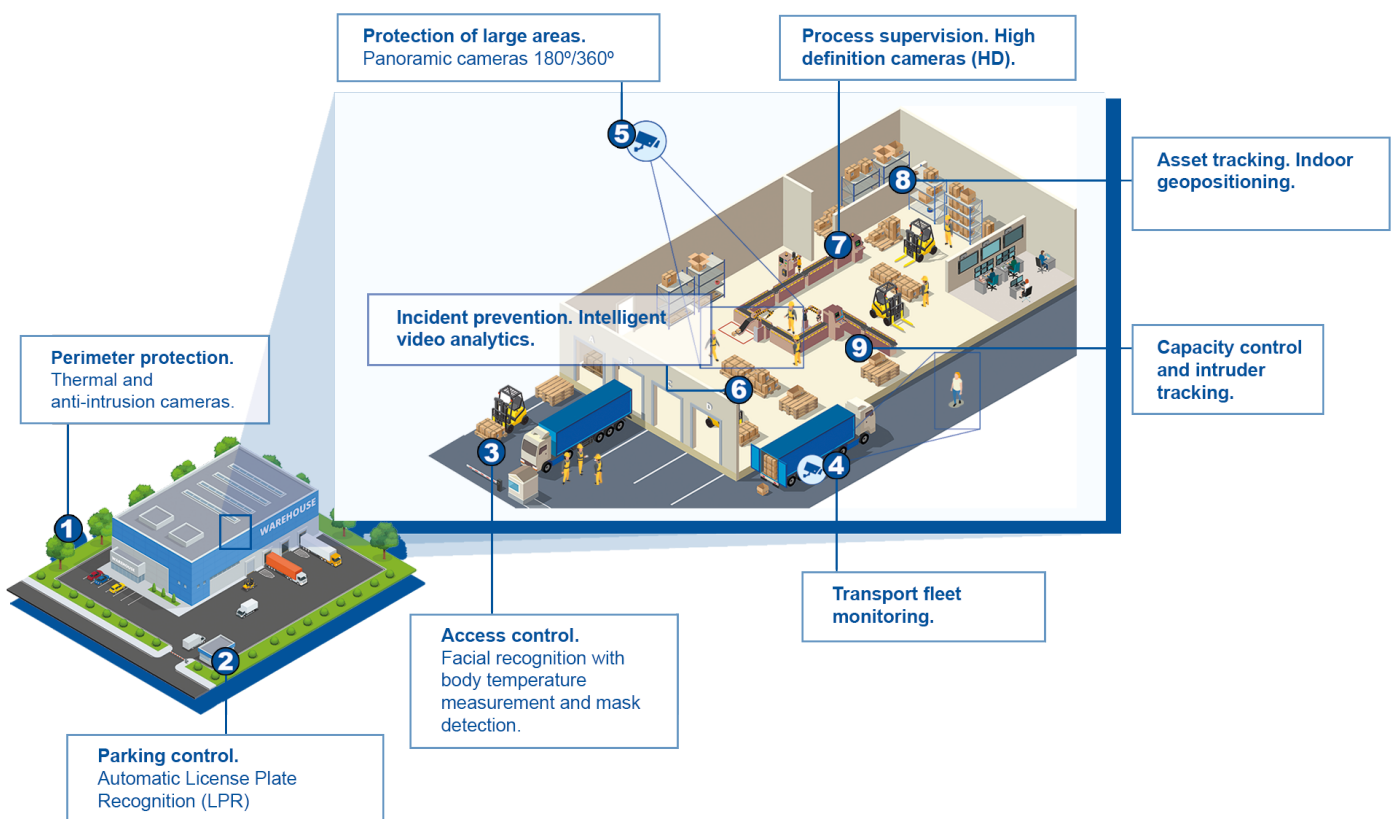

More than 20 years promoting “turnkey projects” for our customers to optimize their processes, ensure traceability of goods, locate their mobile assets and manage their fleet of vehicles.

Our differential value lies in the ability to integrate the SCATI video system with any management system and software to drive the digitization and automation of processes and achieve business excellence.

Comprehensive security solutions.

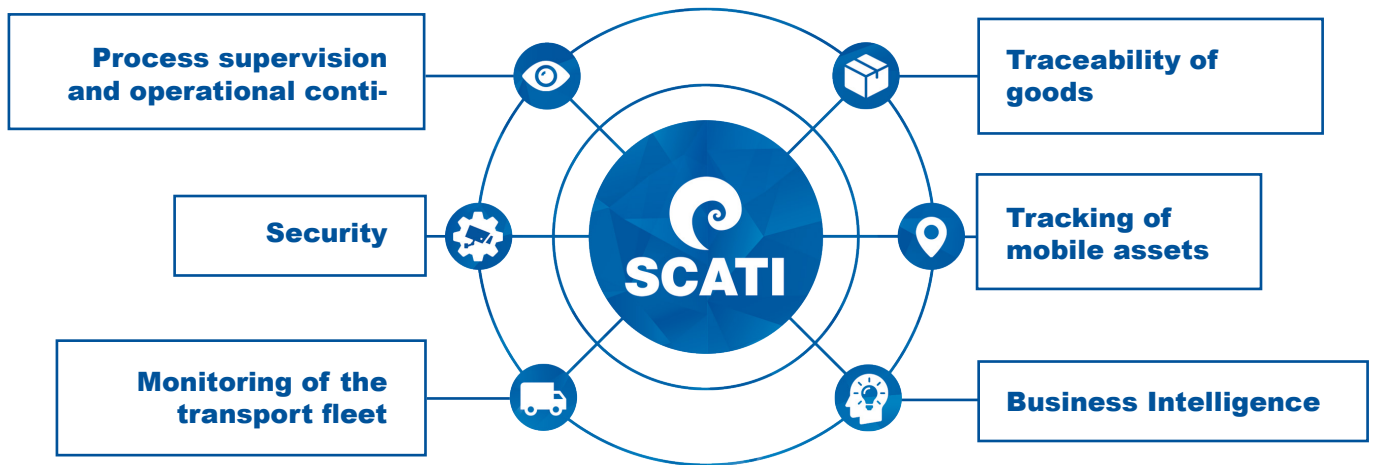

We develop our own software for the management of cameras, alarms, metadata and with the ability to integrate with other third party systems to ensure the total protection of your installation.

The scalability of our video systems allows centralized management of multiple distribution centers from a single control center, maximizing business profitability.

Manage all video devices from our platform and get the most out of your CCTV system.

CCTV SYSTEMS, BEYOND SECURITY

Process supervision and operational continuity.

Video systems are the key to ensuring excellence in production and logistics processes.

Integrated with the usual management systems, they monitor compliance with the protocols in each process (picking, stowage, etc.), detect an incident (stoppage or breakdown of a machine) and alert the control center in real time to resolve the incident in the shortest possible time, minimizing economic and personal losses.

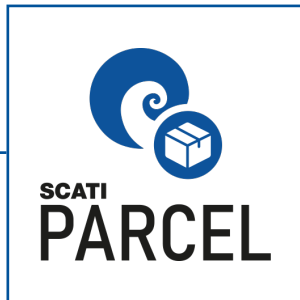

Transport fleet monitoring.

On-board video systems allow real-time visualization and recording of images from any vehicle.

It is possible to know the GPS position of the vehicles in real time, the history of the routes taken and even warn in real time by means of alarms in case the vehicle deviates from the route, leaves its area of influence or exceeds the speed limits.

TRACEABILITY OF GOODS

The video systems monitor and record the process. Together with the image capture performed by the cameras, SCATI PARCEL integrates with the client's systems to obtain the metadata with the information associated with each good (dispatch or tracking number, origin, destination, dimensions, etc.), to present it in a unified way to the user who performs the queries.

With SCATI PARCEL, the user can search by the data of interest associated with the goods, visualize the routes of each one of them and locate the exact moment in which the incident originated through a quick and direct access to a visual check of the recorded video.

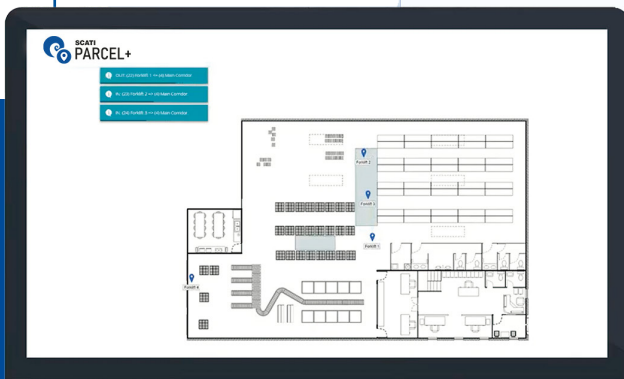

MOBILE ASSET TRACKING

SCATI PARCEL PLUS integrates the video system with a state-of-the-art indoor geolocation system.

Through SCATI Parcel Plus, all mobile assets are located and visualized in real time and automatic alerts are received in case they invade a restricted or hazardous area.

Statistics and information can be obtained for each asset to measure its productivity, its level of activity and speed, and even to know distances, zones traveled and even the average time spent per area.

BUSINESS INTELLIGENCE

SCATI RECKON allows the creation of customizable dashboards or reports adapted to the user's management and exploitation needs.

In addition, SCATI RECKON allows the integration with other BI systems already existing in the company and the export of the information collected so that it can be used by other users or analysis tools.

Data, measurements and information from video surveillance systems can be used by other areas of the company to optimize procedures, improve customer knowledge or increase turnover.
